Abdala Ahmad Fares

Medical Report: Abdalla Ahmad Fares

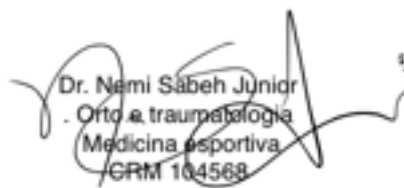

Abdalla has a large lesion in his hip. The diagnosis is orthoses in the right hip from an impact to the acetabulum and femur. He has had three previous surgeries to make him more ambulatory and provide better movement. Today, during his appointment I could see pain and limited movement. Treatment involves physiotherapy to strengthen the muscles so that he can walk and stand for longer periods of time. I have recommended that the patient not stand still for long periods of time because he needs to move often to relieve his pain.

I have recommended that the patient avoid standing for long periods of time and walk slowly until the joint becomes stronger with treatment.

Thank you !
